

① prime number:

```

n = int(input())
if n >= 2:
    f = 0
    for i in range(2, int(n**0.5)+1):
        if n % i == 0:
            f = 1
    if f == 0:
        print('%d is prime' % n)
    else:
        print('%d is not prime' % n).

```

output:

29
29 is prime

② prime numbers range:

```

def primes(n):
    prim = [True] * (n+1)
    prim[0] = prim[1] = False
    p = 2
    while p * p <= n:
        if prim[p]:
            for i in range(p * p, n+1, p):
                prim[i] = False
            p += 1
    return prim[n]

```

x = int(input())

count = 0

number = 2

while count < x:

if primes(number):

count += 1

print(number, end=' ')

number += 1

output: 5

2 3 5 7 11

③ Armstrong or not :

20JRI A05A5

```
x = int(input())
```

```
length = len(str(x))
```

```
temp = x
```

```
sum = 0
```

```
while x > 0 :
```

```
    sum = sum + (x % 10) ** length
```

```
    x = x // 10
```

```
if sum == temp :
```

```
    print(x, 'is prime Armstrong number')
```

```
else : print(x, 'is not Armstrong number')
```

output: 153

153 is Armstrong number

④ Armstrong from n1 to n2 :

```
def arm(n):
```

```
    length = len(str(n))
```

```
    temp = n
```

```
    sum = 0
```

```
    while n > 0 :
```

```
        sum = sum + (n % 10) ** length
```

```
        n = n // 10
```

```
    if sum == temp :
```

```
        print(n)
```

output: 1

9

1 2 3 4 5 6 7 8 9

```
n1 = int(input())
```

```
n2 = int(input())
```

```
for i in range(n1, n2 + 1) :
```

```
    arm(i)
```

⑤ leap year or not

```
y = int(input())
```

```
if (y % 4 == 0 and (y % 100 != 0 or y % 400 == 0)) :
```

```
    print('leap year')
```

```
else :
```

```
    print('non leap year')
```

output: 2024

leap year.

⑥ reverse of given number: (or) palindrome:

$n = \text{int}(\text{input}())$

$\text{temp} = 0$; $t_1 = n$

while $n > 0$:

$\text{temp} = \text{temp} \times 10 + n \% 10$

$n = n // 10$

if $t_1 == \text{temp}$:

$\text{print}(' \text{palindrome}')$

else:
 $\text{print}(' \text{not palindrome}')$

output: 121

palindrome

⑦ $n = \text{int}(\text{input}())$

$\text{temp} = 0$

$t_1 = n$

while $n > 0$:

$\text{temp} = \text{temp} \times 10 + n \% 10$

$n = n // 10$

output: 123

The reverse of given number is 321

$\text{print}(' \text{The reverse of given number is} ', \text{temp})$.

⑧ Fibonacci:

" $n = \text{int}(\text{input}())$

$n_1 = 0$

$n_2 = 0$ "

def $\text{fib}(n)$:

if $n == 0$:

return 0

else if $n == 1$ or $n == 2$:

return 1

else:

return $\text{fib}(n-1) + \text{fib}(n-2)$

$x = \text{int}(\text{input}())$

$\text{print}(\text{fib}(x))$

output: 6

5

⑨ Swapping of elements:

```
a = int(input())
```

```
b = int(input())
```

```
print(a, b)
```

```
#1
```

```
a = a + b
```

```
b = a - b
```

```
a = a - b
```

```
print(a, b)
```

```
output: 10
        20
        20 10
```

```
#2
```

```
a = a * b
```

```
b = a / b
```

```
a = a / b
```

```
print(a, b)
```

```
#3
```

```
a = a ^ b
```

```
b = a ^ b
```

```
a = a ^ b
```

```
print(a, b)
```

⑩ Decimal to binary:

```
n = int(input())
```

```
bin = ''
```

```
while n > 0:
```

```
    bin = str(n % 2) + bin
```

```
    n = n // 2
```

```
print(bin)
```

```
output: 13
```

```
1101
```

⑪ Binary to decimal:

```
binary = input()
```

```
expo = len(binary) - 1
```

```
decimal = 0
```

```
for i in binary:
```

```
    if i == '1':
```

```
        decimal += int(i) * (2 ** expo)
```

```
    expo -= 1
```

```
print(decimal)
```

```
output: 1111
```

```
15
```

(12)

binary to octal :

binary = input()

#check multiple of 3 or not . . .

while len(binary)%3 != 0 :

binary = '0'+binary

octal = ' '

i = 0

while i < len(binary):

decimal = int(binary[i:i+3], 2)

octal = octal + str(decimal)

i += 3

print(octal)

output: 101011
53
